LEDs meaning – EVO4S

LED

LEDs meaning – EVO4S

Question:

How can I interpret my EVO4S LEDs behavior?

Answer:

Above, the possible EVO4S LEDs behaviors are described, specifying each one's meaning:

- **Red LED, slow blinking (+ switched off display; if included):**
It indicates the system has been started in Booter mode, not showing a normal behavior. In this case, it is suggested to update the device firmware, since it can be connected to the PC via USB.
- **Green LED, fixed:**
Indicates the system is correctly powered up.
- **Red LED, slow blinking -> Red LED, fast blinking -> device reboot:**
this behavior indicates the good result of the firmware upgrade process (together with a displayed popup message, if present).
- **Blue LED, fast blinking:**
Indicates the overwriting of the transmitted configuration.
- **Cyan LED; fixed:**
Indicates the system is recording data.
