

Possible AiM software crashes due to AVG antivirus

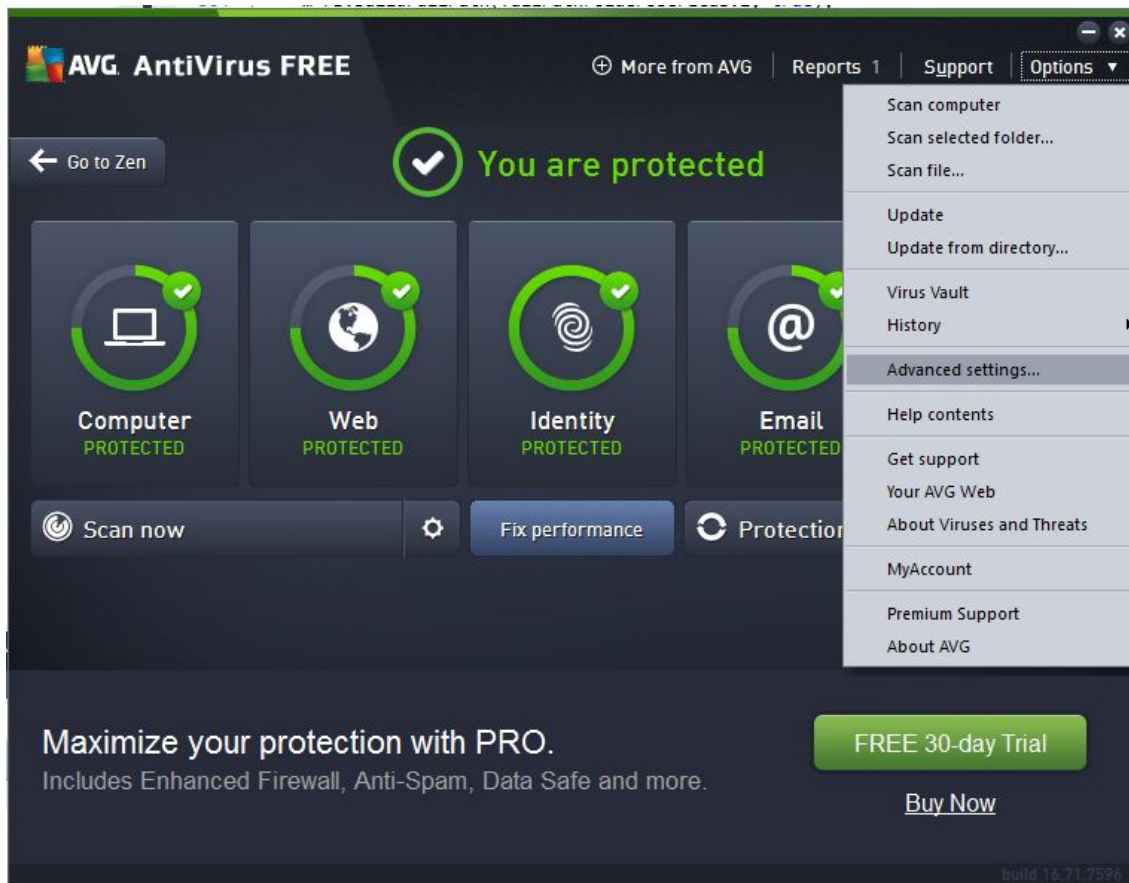

On the web you can find antivirus or antimalware software that protects your PC from possible bad downloadable stuff. We're not able to understand how, but we can say that some of them, like AVG, generate crashes to some of our software, as they lock or forbid the proper work of some operating system application programming interfaces.

When using AVG antivirus, either the free version or the complete one, to prevent AiM software crashes apply the following procedure.

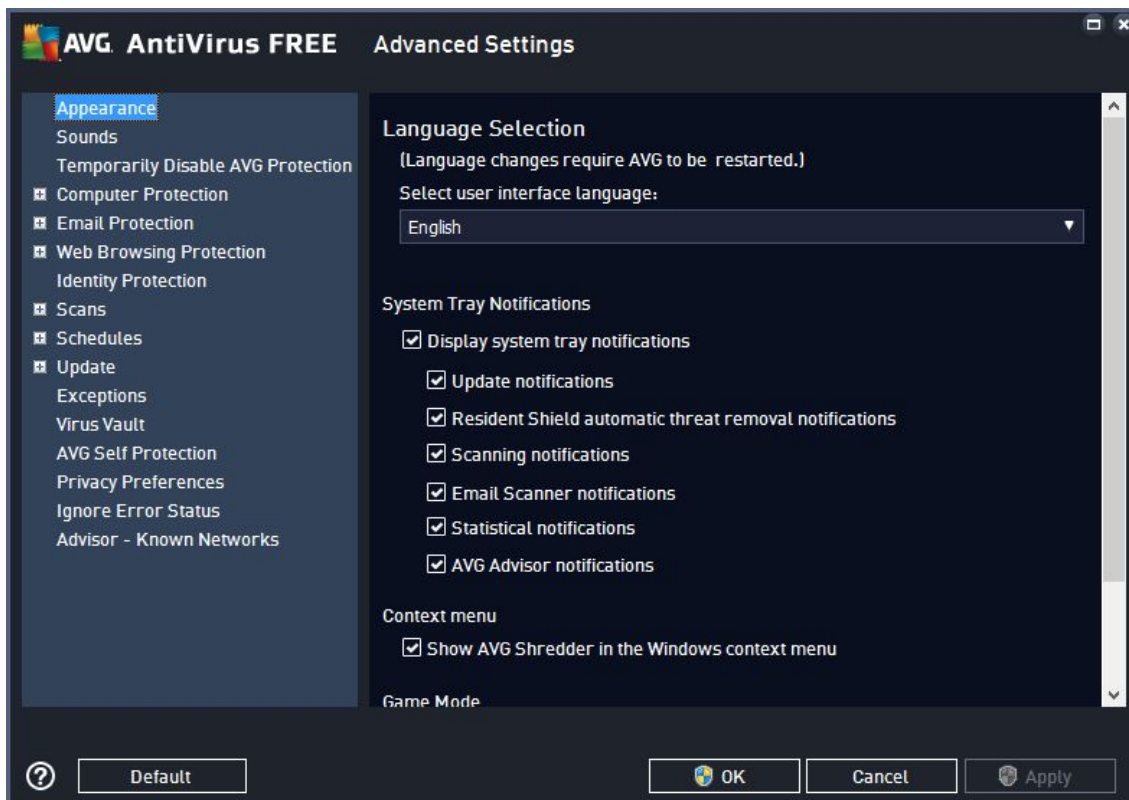

Open the AVG main interface

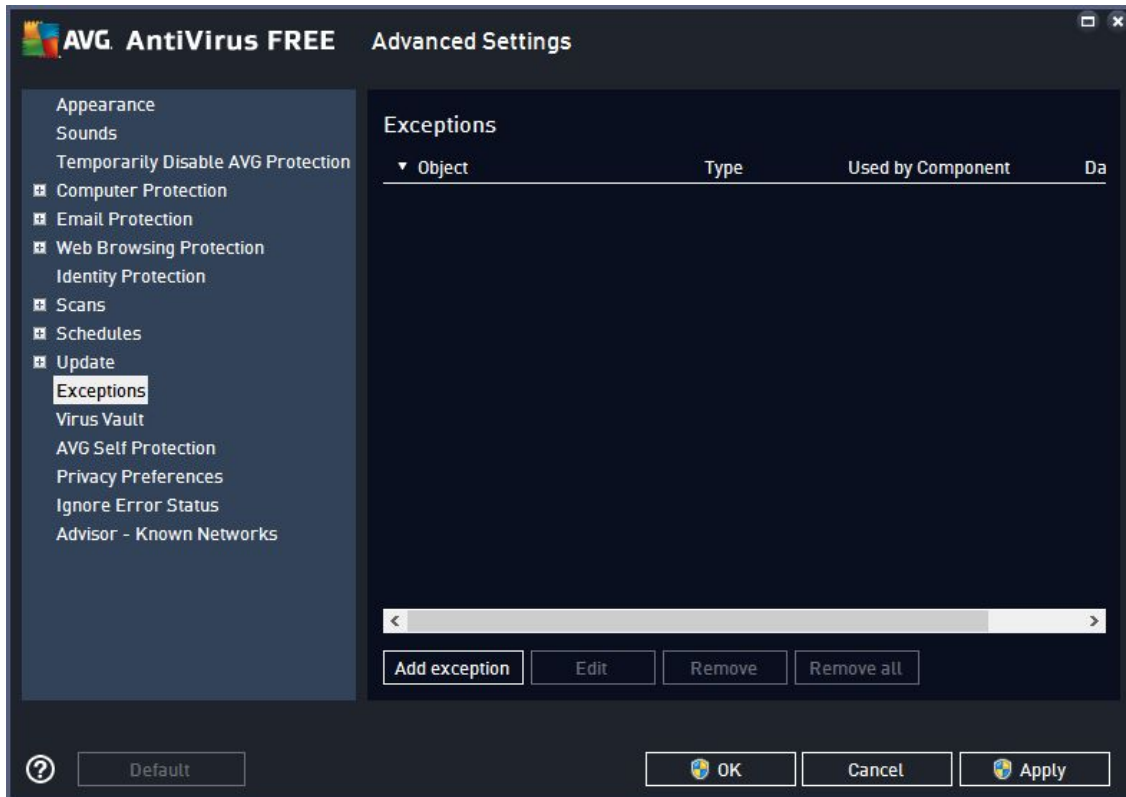

Choose menu "Options" then "Advanced settings..."

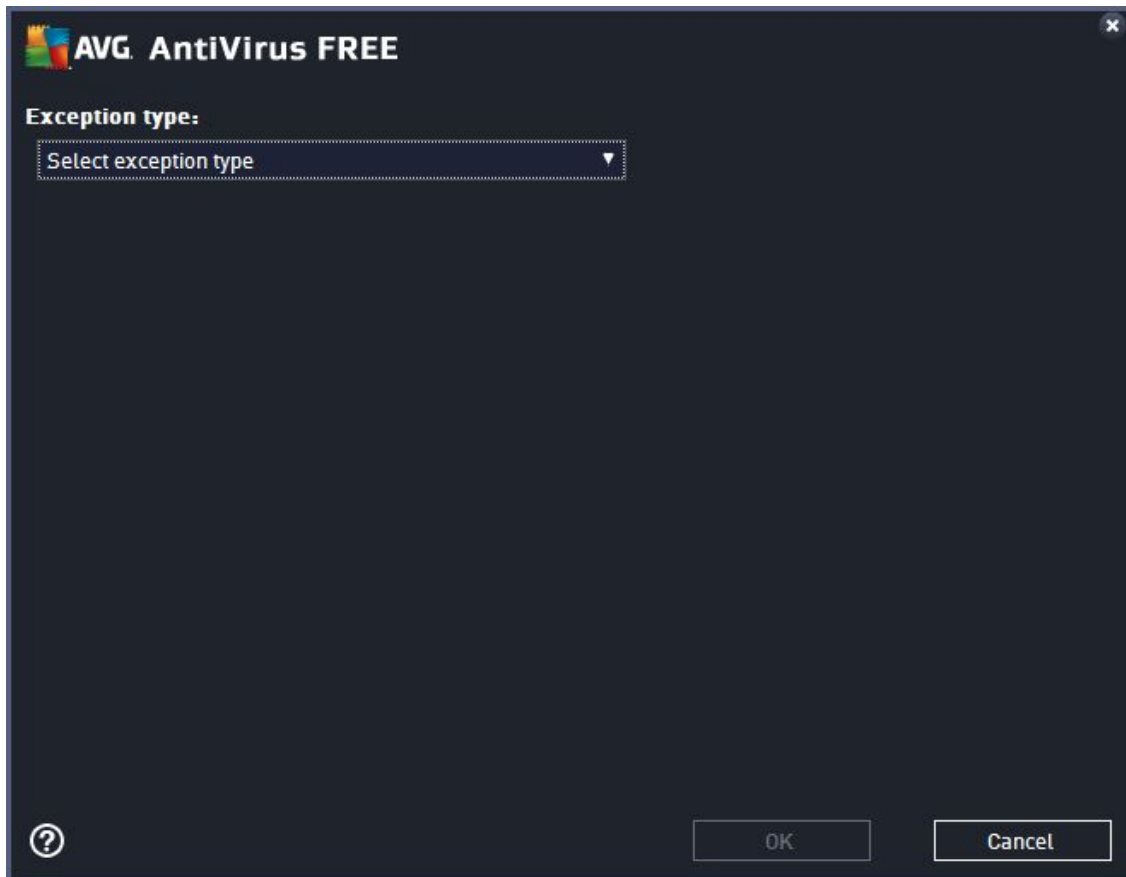

A new window will be prompted

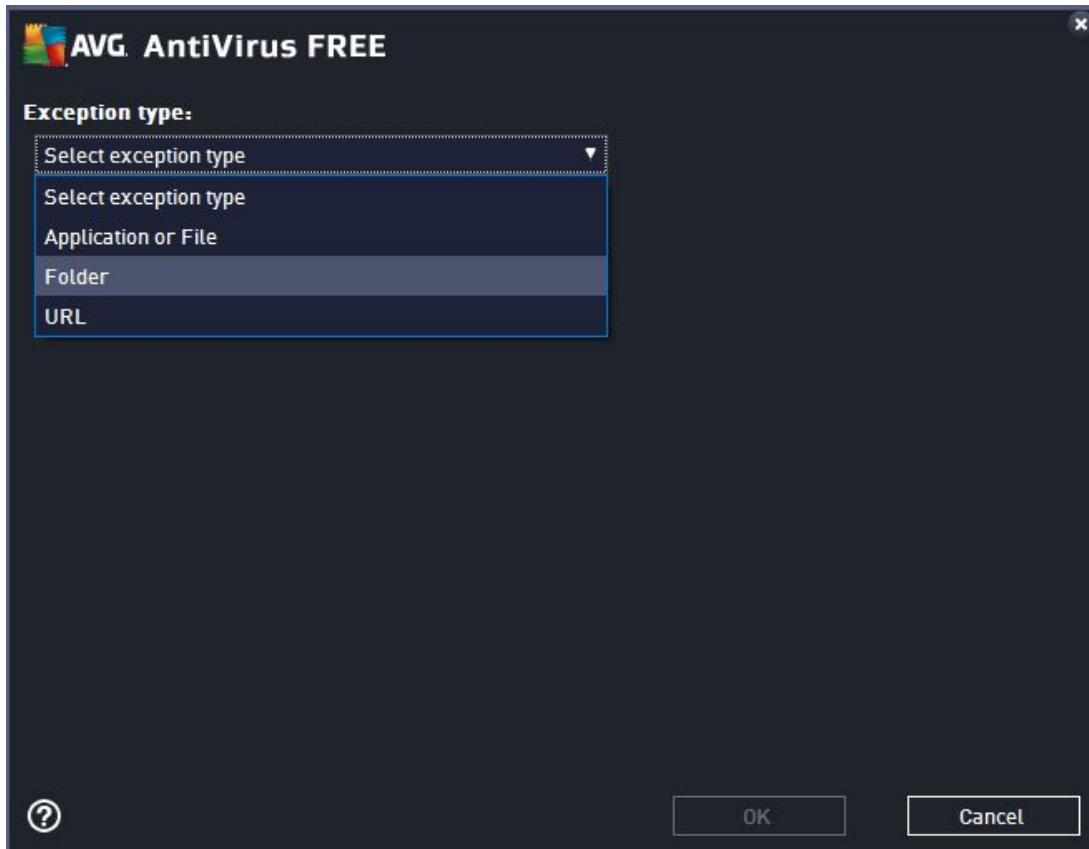

Choose "Exceptions" in the list at the left

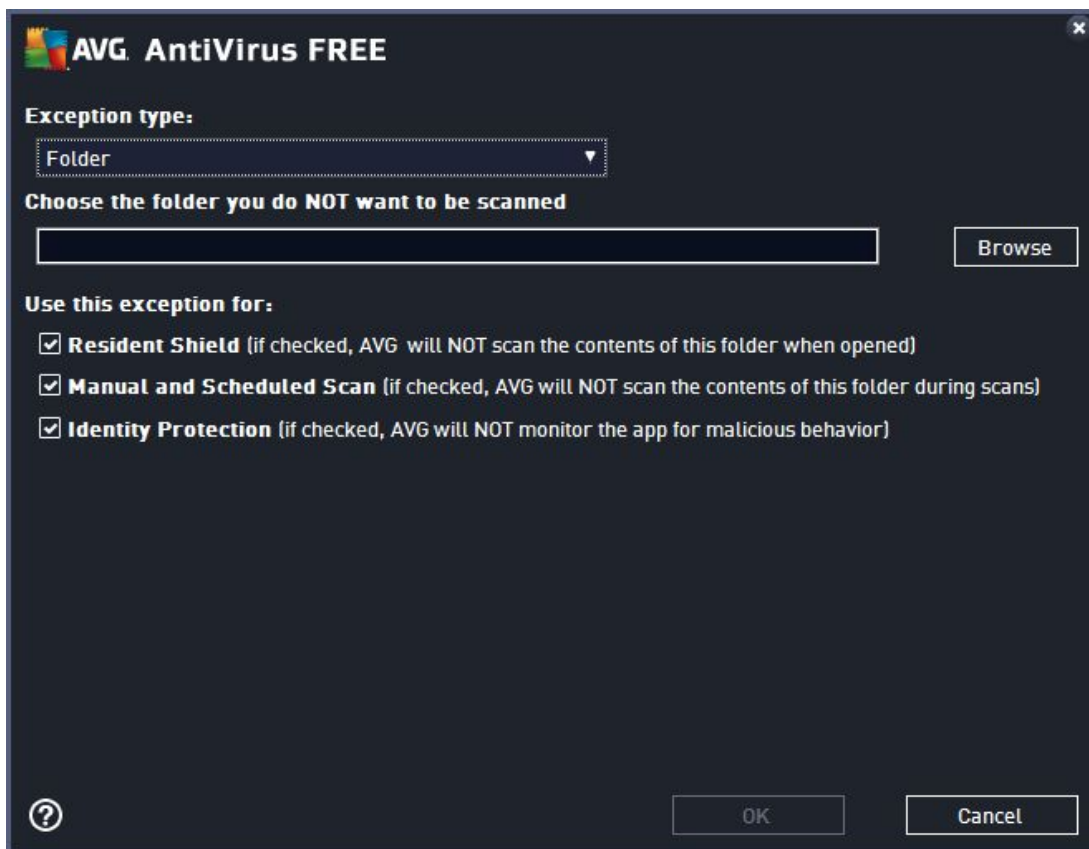

Click the "Add exception" button, a new window will be prompted

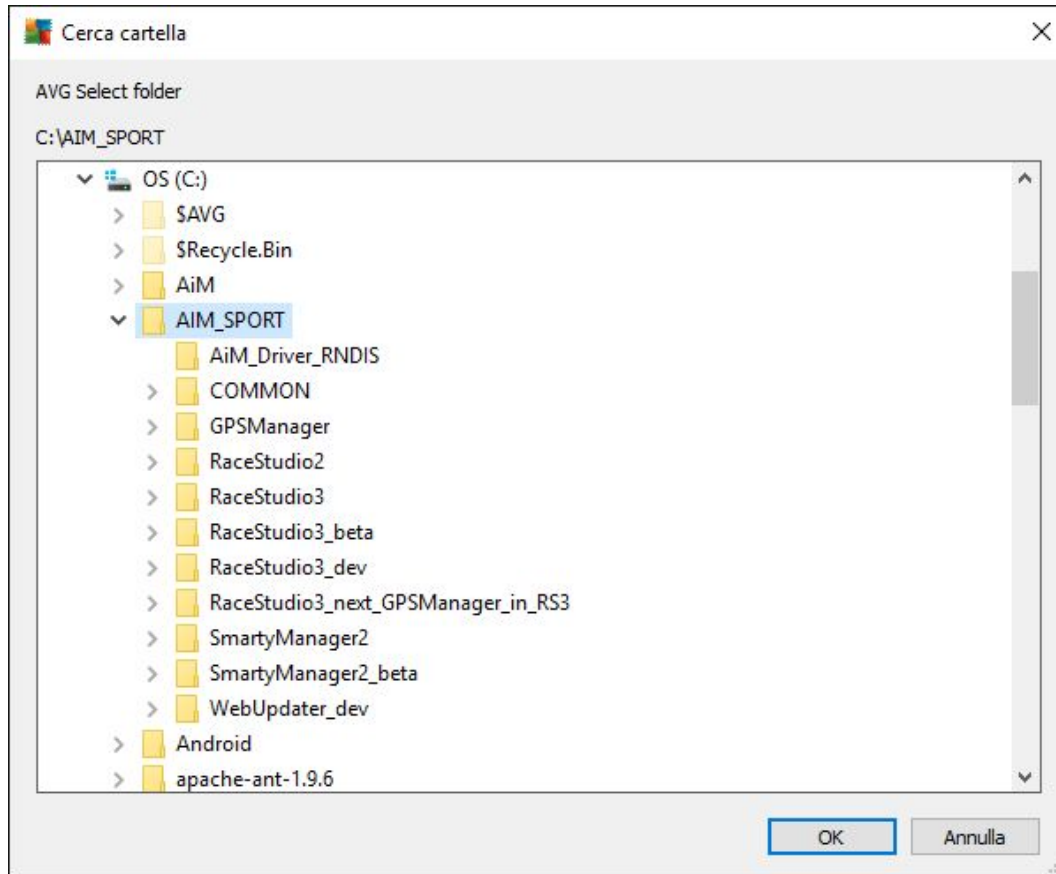

Choose "Folder" as exception type

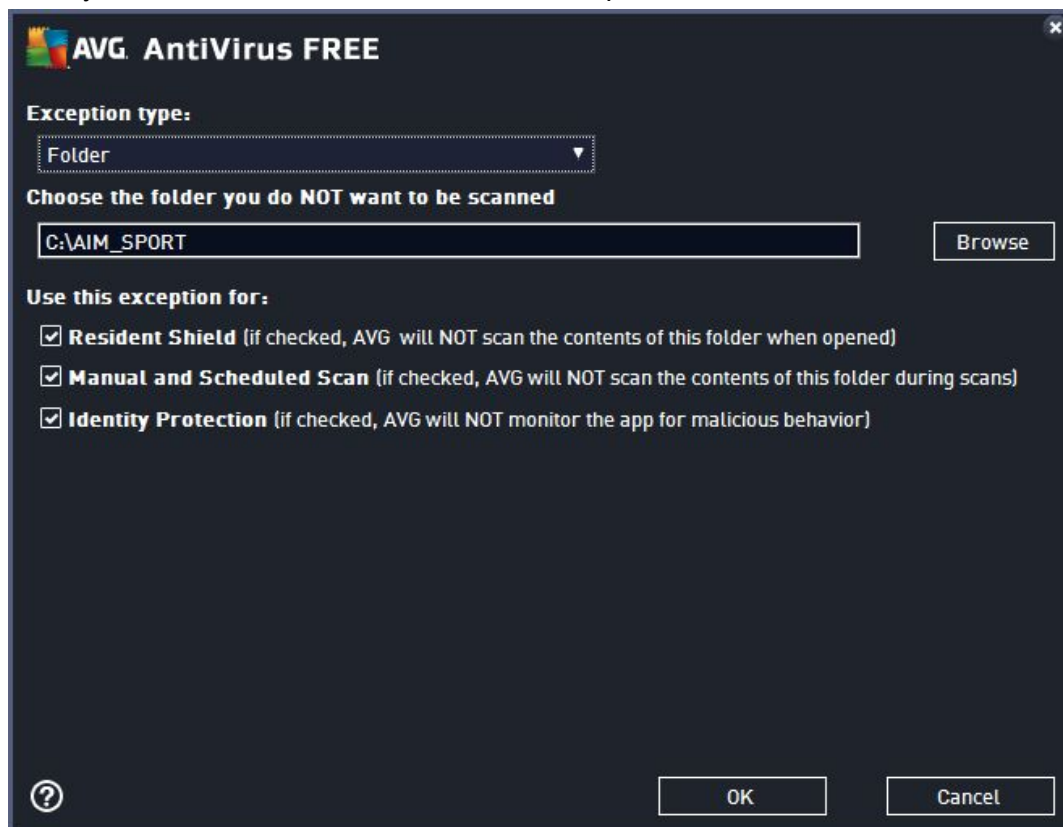

Click the "Browse" button

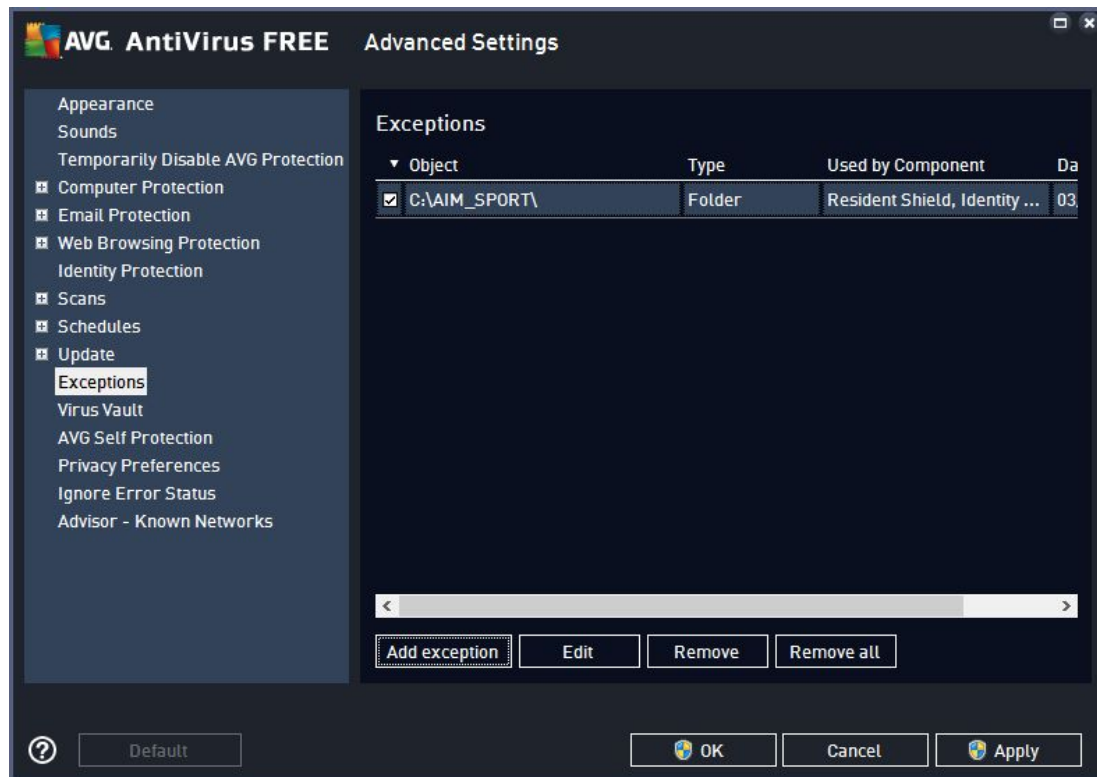

Navigate to the AiM installation folder, normally "C:\AIM_SPORT"

Once you select the AiM installation folder the previous window will look like this

Click "OK", then you'll get this

Click "OK" and confirm the administrator only action.
